-!- CATALYTIC ACTIVITY: ATP + L-aspartate + tRNA(Asp) = AMP + diphosphate + L-asparty1-tRNA(Asp).
-!- SUBUNIT: Homodimer (By similarity).
-!- SUBCELLULAR LOCATION: Cytoplasmic.
-!- SUBCELLULAR LOCATION: Cytoplasmic.
-!- SIMILARITY: Belongs to the class-II aminoacy1-tRNA synthetase
                                                                                                                                                                                                                                                                                                                                                                                                                                                  "Genome sequence of an obligate intracellular pathogen of humans:

Nucleic Acids Res. 28:1397-1406(2000).
-!- CATALYTIC ACTIVITY: ATP + L-aspartate + tRNA(Asp) = AMP + diphosphate + L-asparty!-tRNA(Asp).
-!- SUBUNIT: Homodimer (By similarity).
-!- SUBCELLULAR LOCATION: Cytoplasmic.
-!- SIMILARITY: Belongs to the class-II aminoacyl-tRNA synthetase
                                                                                                                                                                                                                                                                                                                                                     SEQUENCE FROM N.A.

## ALIGNMENTS

The present invention relates to a method for modulating the oxidative stress level in a cell or a patient, comprising contacting the cell with, or administering to the patient, an oxidative stress regulator selected from colostrinii, or its constituent peptide (e.g. the present peptide), to change the level of an oxidising species in the cell. The method can be used to treat oxidative damage to skin, by decreasing or preventing an increase in the level of damage to a biomolecule of the patient Modulating oxidative stress level in a cell, involves contacting the with an oxidative stress regulator selected from colostrinin, its constituent peptide, analog or their combinations. Length 15 Dermatological; oxidative stress regulator; colostrinin. Query Match 100.0%; Score 81; DB 4; L Best Local Similarity 100.0%; Pred. sequences AAB72246 - AAB72275 represent peptides derived from clostrinin, a proline rich polypeptide aggregate contained in colostrum. The peptides have immune response modulatory activity, and are capable of inducing cytokines. Colostrinin and its derived peptides are useful for inducing production, for modulating an immunological response and for inducing blood cell proliferation. The peptides are useful in the treatment of disorders of the central nervous system, neurological tail disorders, dementia, neurodegenerative diseases, Alzheimer's disease, motor neurone disease, psychosis, neurosis, chronic diseases of the immune system, bacterial and viral infections and acquired immunological deficiencies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Neuroprotective; neural cell differentiation regulator; colostrinin;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention provides the sequences of a number of peptides found in ewe's colostrinin. Colostrinin is the proline-rich polypeptide fragment of colostrum. These peptides can be used in the treatment of central nervous system disease, such as senile dementia, Parkinson's disease, Alzheimer's disease, psychosis and neurosis, immune system disorders such as bacterial and viral infections, to improve the development of a child's immune system, as a dietary supplement, and to promote the dissolution of beta-amyloid plaques

The present sequence is that of a colostrinin constituent peptide that is preferred for use as an immunological regulator and as a blood cell constituent in claimed methods of the invention. Methods are claimed for: inducting a cytokine in a cell by contact with an immunological regulator, where the cell is present in a cell by contact with an immunological regulator, corganism, and the cell is mammalian, including human; modulating an corganism, and the cell is mammalian, including human; modulating an corganism conditions effective to induce a cytokine; modulating an immunological regulator under conditions effective to induce a cytokine, where the immunological conditions effective to induce a cytokine, where the immunological regulator under conditions effective to induce a cytokine, where the immune response is specific or non specific, an interferon regulator is administered topically or as part of a dietary supplement. Cand where the immune response; modulating blood cells with a blood cell regulator, where the blood cells or contexting blood cells with a blood cell regulator, where the blood cells are increased in number or differentiated; and a method for modulating blood cell proliferation in a patent. A claimed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Modulation of blood cell proliferation in a patient involves use of blood cell regulator selected from colostrinin, its constituent peptide and/or
invention is useful for promoting the differentiation of cells and for treating damaged neural cells in a patient. The present amino acid sequence represents a specifically claimed colostrinin peptide used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Colostrinin; colostrum; immunomodulator; cardiovascular; blood cell regulator; cytokine inducer; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /note= "optional C-terminal amidation"

The method involves contacting cells with a neural cell regulator (i.e. a colostrinin peptide) in order to change the cells in morphology to form neural cells. Colostrinin is a proline-rich polypeptide aggregate that is present in colostrum. The method of the
                                                                                                                                            Use of colostrinin, its constituent peptide or analog as a neural cell regulator, for promoting neural cell differentiation and treating damaged neural cells in a patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Neural cell differentiation; neural cell regulator; colostrinin peptide; neural cell formation; proline-rich polypeptide aggregate; colostrum; neural cell treatment.
                                                                                                                                                                                                                                                                                    The present invention relates to a method for promoting neural cell differentiation and treating damaged neural cells, using colostrinin and colostrinin peptides (e.g. the present peptide) as a neural cell regulator. Colostrinin is a polypeptide complex found in colostrum
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Promoting cell differentiation in a patient involves use of blood cell regulator selected from colostrinin, its constituent peptide and/or

The invention relates to a composition which comprises a blood cell regulator selected from colostrinin, its constituent peptide and/or regulator selected from colostrinin, its constituent peptide and/or analogue. The invention is used for modulating the oxidative stress level or each se, or manmalian or human cell present in a cell culture, tissue, or organ, or organism; or for treating oxidative damage to the skin of a premature birth or normal birth, preventing/delaying aging in a premature birth or normal birth, preventing/delaying aging in a premature birth or normal birth, preventing/delaying aging in a patient, enhancing wound healing, and the reduction of side effects of cosmetic procedures. The method changes the level of an oxidising species in the cell, such as decreases or prevents increase in the level of an oxidising species in the cell, such as decreases or prevents increase in the level of inpid, compared to the same conditions when the oxidative stress results in regulator is not present. The modulation of oxidative stress results in conditions and replacement of cells, tissues and organs (e.g. kidney, liver, pancreas, skin, and the other internal and external organs), as well as enhanced preservation of such organs for
                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Blood cell regulator; colostrinin; constituent peptide; oxidative stress; therapy; oxidative damage; skin; aging; wound healing; cell replacement; tissue; oxgan; cosmetic procedure; repair; regeneration; preservation; transplantation; implantation; dermatological; vulnerary.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Composition useful for the modulation of blood cell proliferation in a patient comprises a blood cell regulator selected from colostrinin, its constituent peptide and/or analog.
cytokine-inducing composition comprises a pharmaceutical carrier and an active agent such as the present peptide. Cytokines induced by this peptide in human leucocyte cultures include interferon-gamma, tumour necrosis factor-alpha, interleukin-4, interleukin-6 and interleukin-10
                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                     ;

The present invention describes the use of a modulator selected from colostrinin, its constituent peptide, its active analogue, and a colostrinin, its constituent peptide, its active analogue, and a combination of these, for modulating an intracellular signaling molecule in a cell, down regulating 4HRE-mediated lipid peroxidation in a cell, and reducing the toxic effect of beta-amyloid or retinoic acid on a cell. The modulator has cytostatic activity, and can be used as a 4HNE contains a tell in the manufacture of a medicament for inhibitor. The modulator is useful in the manufacture of a medicament for reducing 4HNE-protein adduct formation, inhibiting 4HNE-mediated civation of c-Jun NHZ-terminal kinases and/or inhibiting almost activation of c-Jun NHZ-terminal kinases. Colostrinin, or its constituent peptide or active analogue is useful for inhibiting apoptosis in a cell, protecting against DNA damage in a cell, or reducing the toxic effect of beta-amyloid or retinoic acid on a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Use of colostrinin for e.g. modulating an intracellular signaling molecule in a cell, down regulating 4HNE-mediated lipid peroxidation in a cell, inhibiting apoptosis in a cell, or protecting against DNA damage in

The invention provides a method for the recovery of peptides (especially colostrinin) from colostrum in substantially pure, biologically active form and in high yield. The method involves mixing the colostrum with an alcohol to form an alcohol phase containing the colostrinin and a precipitate containing higher molecular weight caseins and other proteins. Best results are obtained using methanol or ethanol of at least 80%, and preferably up to 100%, purity. The alcohol phase is then separated from the precipitation dente colostrinin is separated from the alcohol phase or, preferably, to the colostrinin-rich phase. Which is recovered. A precipitation agent, such as ammonium sulfate, may be added either to the alcohol phase or, preferably, to the colostrinin-rich phase to induce precipitation of the colostrinin peptides. The method is generally applicable to the separation of peptides from fluids containing higher molecular weight proteins, lipids, carbohydrates and/or nucleic acids. In an example from the invention, the antigenic profile of peptides recovered from sheep colostrum using the present sequence apprended agained applicable to prepride having the present sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sheep; colostrinin; proline rich polypeptide; colostrum; immune disorder; central nervous system disorder; dietary supplement; beta-amyloid plaque.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention provides the sequences of a number of peptides found in ewe's colostrinin. Colostrinin is the proline-rich polypeptide fragment of colostrum. These peptides can be used in the treatment of central nervous system disorders such as senile dementia, Parkinson's disease, Alzheimer's disease, psychosis and neurosis, immune system development of a child's immune system, as a dietary supplement, and to promote the dissolution of beca-amyloid plaques

Sequence 29412, Application US/09252991A

Patent No. 651795

Patent No. 651795

GENERAL INFORMATION:

APPLICANT: Marc J. Rubenfield et al.

APPLICANT: Marc J. Rubenfield et al.

APPLICANT: Marc J. Rubenfield et al.

APPLICANTON: NUCLEIC ACID AND AND AND THERAPEUTICS

TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

FILE REFRENCE: 107196.136

CURRENT FILING DATE: 1999-02-18

PRIOR PELING DATE: 1998-02-18

PRIOR APPLICATION NUMBER: US 60/074,788

PRIOR APPLICATION NUMBER: US 60/094,190

PRIOR FILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 822. Application US/09538092

Sequence 822. Application US/09538092

Patent No. 6753314

GENERAL INFORMATION:

APPLICANT: Gict, Loic

APPLICANT: Gict, Loic

TITLE OF INVENTION: Protein-Protein Complexes and Method of Using Same

TITLE OF INVENTION: Protein-Protein Complexes and Method of Using Same

TITLE REPERENCE: 1596-542

CURRENT APPLICATION NUMBER: 60/127,352

PRIOR FILING DATE: 2000-03-29

PRIOR FILING DATE: 2000-02-01

NUMBER OF SEQ ID NOS: 1387

SOFTWARE: CuraPatSeqFormatter Version 0.9

SEQ ID NO 822

and mouse CDNA sequences.";
Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).
-!- FUNCTION: Acts as a RACI guanine nucleotide exchange factor (GEF)
and can induce membrane ruffling (By similarity).
-!- SUBUNIT: Interacts with PAK kinases through the SH3 domain.
Interacts with GIII (By similarity).
-!- ALTENNATIVE PRODUCTS:
                                                                           Ω.
Q
                                                                                                                                                                                                                                                                                       [2]

## ALIGNMENTS

The present invention relates to a method for modulating the oxidative stress level in a cell or a patient, comprising contacting the cell with, or administering to the patient, an oxidative stress regulator selected from colostrinin, or its constituent peptide (e.g. the present peptide), to change the level of an oxidising species in the cell. The method can be used to treat oxidative damage to skin, by decreasing or preventing an increase in the level of damage to a biomolecule of the patient Modulating oxidative stress level in a cell, involves contacting the cell with an oxidative stress regulator selected from colostrinin, its constituent peptide, analog or their combinations. Sequences AAB72246 - AAB7225 represent peptides derived from clostrinin, ab politic rich polypeptide aggregate contained in colostrum. The peptides have immune response modulatory activity, and are capable of inducing cytokines. Colostrinin and its derived peptides are useful for inducing inducing production, for modulating an immunological response and for inducing blood cell proliferation. The peptides are useful in the treatment of disorders of the central nervous system, neurological disorders, mental disorders, dementia, neurodegenerative diseases, Alzheimer's disease, motor neurone disease, psychosis, neurosis, chronic disorders of the immune system, bacterial and viral infections and acquired immunological deficiencies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Neuroprotective; neural cell differentiation regulator; colostrinin;

Colostrinin is the proline-rich polypeptide fragment of colostrum. These peptides can be used in the treatment of central nervous system disorders such as senila dementia, Parkinson's disease, Alzhaimer's disease, psychosis and neurosis, immune system disorders such as bacterial and viral infections, to improve the development of a child's immune system, as a dietary supplement, and to promote the dissolution of beta-amyloid plaques

The present sequence is that of a colostrinin constituent peptide that is preferred for use as an immunological regulator and as a blood cell regulator in claimed methods of the invention. Methods are claimed for: inducing a cytokine in a cell by contact with an immunological regulator, where the cell is present in a cell by contact with an immunological regulator, where the cell is mammalian, including human; modulating an corganism, and the cell is mammalian, including human; modulating an corganism, and the cell by contact with the immunological regulator under conditions effective to induce a cytokine; modulating an immunological regulator under regulator is administered topically or as part of a dietary supplement, and where the immuno esponse is specific or non specific, an interferon response or an antibody response; modulating blood cell proliferation by contacting blood cells with a blood cell regulator, where the blood cells with a blood cell regulator, where the blood cells are increased in number or differentiated, and a method for modulating blood cell proliferation in a patent. A claimed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Modulation of blood cell proliferation in a patient involves use of blood cell regulator selected from colostrinin, its constituent peptide and/or
invention is useful for promoting the differentiation of cells and for treating damaged neural cells in a patient. The present amino acid sequence represents a specifically claimed colostrinin peptide used in
                                                                                                                                                         5; Length 15;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention comprises a method for promoting cell differentiation (e.g. neural cell differentiation). The method involves contacting cells with a neural cell regulator (i.e. a colostrinin peptide) in order to change the cells in morphology to form neural cells. Colostrinin is a proline-rich polypeptide aggregate that is present in colostrum. The method of the
                                                                                                                                  Use of colostrinin, its constituent peptide or analog as a neural cell regulator, for promoting neural cell differentiation and treating damaged neural cells in a patient.
                                                                                                                                                                                                                                                                 The present invention relates to a method for promoting neural cell differentiation and treating damaged neural cells, using colostrinin and colostrinin peptides (e.g. the present peptide) as a neural cell regulator. Colostrinin is a polypeptide complex found in colostrum
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Neural cell differentiation; neural cell regulator; colostrinin peptide; neural cell formation; proline-rich polypeptide aggregate; colostrum; neural cell treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Promoting cell differentiation in a patient involves use of blood cell. regulator selected from colostrinin, its constituent peptide and/or

                                                                                                                         ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a composition which comprises a blood cell cregulator selected from colostrinin, its constituent peptide and/or regulator selected from colostrinin, its constituent peptide and/or analogue. The invention is used for modulating the oxidative stress level corgan, or organism; or for treating oxidative damage to the skin of a corgan, or organism; or for treating oxidative damage to the skin of a parameture birth or normal birth, preventing/delaying aging in a copilation, enhancing wound healing, and the reduction of side effects of patient, enhancing wound healing, and the reduction of side effects of commetic procedures. The method changes the level of an oxidiating species or in the cell, such as decreases or prevents increase in the level of in the cell, such as decreases or prevents increase in the level of amage to a biomolecule of the patient selected from DNA, protein and/or lipid, compared to the same conditions when the oxidative stress results in combanced repair, regeneration, and replacement of cells, tissues and corgans (e.g. kidney, liver, pancreas, skin, and the other internal and organs for external organs), as well as enhanced preservation of such organs for
                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                               Blood cell regulator; colostrinin; constituent peptide; oxidative stress; therapy; oxidative damage; skin; aging; wound healing; cell replacement; tissue; oxgan; cosmetic procedure; repair; regeneration; preservation; transplantation; implantation; dermatological; vulnerary.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Composition useful for the modulation of blood cell proliferation in a patient comprises a blood cell regulator selected from colostrinin, its constituent peptide and/or analog.
 cytokine-inducing composition comprises a pharmaceutical carrier and an active agent such as the present peptide. Cytokines induced by this peptide in human leucocyte cultures include interferon-gamma, tumour necrosis factor-alpha, interleukin-6 and interleukin-10
                                                                                                                             Gaps

```
The present invention describes the use of a modulator selected from colostrinin, its constituent peptide, its active analogue, and a colostrinin, its constituent peptide, its active analogue, and a colostrinin of these, for modulating an intracellular signaling molecule combination of these, for modulating an intracellular signaling molecule in a cell, down regulating HWE-mediated lipid peroxidation in a cell, can deducing the toxic effect of beta-amyloid or retinoic acid on a cell. The modulator has cytostatic activity, and can be used as a 4HNE colostriniator. The modulator is useful in the manufacture of a medicament for inhibitor. The modulator is useful in the manufacture of a medicament for glutathione depletion, inhibiting 4HNE-induced activation of c-Jun NH2-terminal kinases. Colostrinin, or its constituent peptide or active analogue is useful for colostrinin, or its constituent peptide or active analogue is useful for colostrinin apoptosis in a cell, protecting against DNA damage in a cell, or reducing the toxic effect of beta-amyloid or retinoic acid on a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Use of colostrinin for e.g. modulating an intracellular signaling: molecule in a cell, down regulating 4HNE-mediated lipid peroxidation in a cell, inhibiting apoptosis in a cell, or protecting against DNA damage in

Peptides having an N-terminal amino acid sequence isolated from colostrinin for treating e.g. disorders of the central nervous system and immune system, viral and bacterial infections, and diseases characterized
                                                                                                                                                                                                                                                                                                                                                                    Sheep, colostrinin, proline rich polypeptide, colostrum, immune disorder, central nervous system disorder, dietary supplement, beta-amyloid plaque.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention provides the sequences of a number of peptides found in ewe's colostrinin. Colostrinin is the proline-rich polypeptide fragment of colostrum. These peptides can be used in the treatment of central nervous system disorders such as senile dementia, parkinson's disease, Alzheimer's disease, psychosis and neurosis, immune system disorders such as bacterial and viral infections, to improve the development of a child's immune system, as a dietary supplement, and to promote the dissolution of beta-amyloid plaques
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                100.0%; Score 82; DB 4; Length 16; 100.0%; Pred. The invention or provides a method for the recovery of peptides (especially colostrinin) from colostrum in substantially pure, biologically active form and in high yield. The method involves mixing the colostrum with an alcohol to form an alcohol phase containing the colostrinin and a precipitate containing higher molecular weight caselns and other proteins. Best results are obtained using methanol or ethanol of at least 80% and precipitate, and the colostrinin is separated from the precipitate, and the colostrinin is separated from the alcohol, preferably by evaporation, to form a colostrinin-rich phase, which is recovered. A precipitation agent, such as ammonium sulfate, may be added to induce precipitation of the colostrinin peptides. The method is colostrinin applies on the colostrinin rich phase to induce precipitation of the colostrinin peptides. The method is generally applicable to the separation of peptides from fluids containing applier molecular weight proteins, lipids, carbohydrates and/or nucleic,

The invention relates to a gamma-glutamyl cysteine synthetase named CCC HpGSH2 (ADPB8214) from the mechanol-assimilating yeast Hansenula HpGSH2 (ADPB8214) from the mechanol-assimilating yeast Hansenula polymorpha (also known as Pichia angusta), nucleic acid sequences polymorpha (also known as Pichia angusta), nucleic acid sequences cincenting HpGSH2 (promoter. The encoding HsGSH2 (AppB8215), and the HpGSH2 promoter. The cincention also relates to expression vectors and host Escherichia coli cells comprising the HpGSH2 coding sequence. HpGSH2 has 53% identity and CGP similarity to the Saccharomyces cerevisiae ScGship protein, 46% identity and 63% similarity to the Saccharomyces cerevisiae CG Schizosaccharomyces pombe SpGcslp protein, and 45% identity and 63% similarity to the Numan HsGSH2, like other gamma-glutamyl cysteine synthetases, is involved in the biosynthesis of glutathione, CG systeine synthetases, is involved in the biosynthesis of glutathione, CG which plays a key role in the detoxification of substances such as heavy which HpGSH2-encoding nucleic acids may be used for generating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel genomic DNA comprising gamma-glutamyl cysteine synthetase gene and its promoter derived from Hansenula polymorpha, useful in mass production of glutathione.

Glutathione may be used to improve liver function, as a nutritional gupplement or food additive (e.g., in sports drinks), as a decoxifying agent, as an agent for adsorption of heavy metals, and in enzyme production. The HpGSH2-encoding nucleic acids may also be used to restore cell growth function to glutathione synthesis-defective host cells. The HpGSH2 promoter may be used in reporter constructs useful in the detection of toxic substances such as heavy metals. The present sequence represents the Hansenula polymorpha gamma-glutamyl cysteine synthetase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a pulypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in
                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 repressent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this spatent did not appear in the printed specification, but was obtained in the printed specification, but was obtained in ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                  Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.

Sequence 16790, Application US/09248796A

Patent No. 6747137
GENERAL INFORMATION:

APPLICANT: Keith Weinstock et al

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO CANDIDA ALBICAN

TITLE OF INVENTION: FOR DIAGNOSTICS AND THERAPEUTICS

FILE REFERENCE: 107196_132

FILE REPERIORS: 107196_132

CURRENT APPLICATION NUMBER: US 60/074,725

PRIOR APPLICATION NUMBER: US 60/074,725

APPLICANT: Keith Weinstock et al
APPLICANT: Keith Weinstock et al
APPLICANT: Keith Weinstown NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO CANDIDA ALBICAN
TITLE OF INVENTION: NUCLEIC ACID AND THERAPEUTICS
FILE REFERENCE: 107196.132
CURRENT APPLICATION NUMBER: US /09/248,796A
CURRENT FILING DATE: 1999-02-12
PRIOR APPLICATION NUMBER: US 60/074,725
PRIOR APPLICATION NUMBER: US 60/096,409
PRIOR APPLICATION NUMBER: US 60/096,409
PRIOR FILING DATE: 1998-08-13
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 5541, Application US/09328352
Patent No. 6562958
GENERAL INFORMATION:
Patent No. 6562958

GENERAL INFORMATION:
TITLE OF INVENTION: NUCLEIC ALID AND AMINO ACID SEQUENCES RELATING TO ACINETOBACTER
TITLE OF INVENTION: BAUMANNII FOR DIAGNOSTICS AND THERAPEUTICS
FILE REPRENCE: GTC99-03PA
CURRENT APPLICATION VUMBER: US/09/328,352
CURRENT FILING DATE: 1999-06-04
NUMBER OF SEQ ID NOS: 8252
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ) Sequence 5199, Application US/09328352; Patent No. 6562958; Canera A. Canera A. Canera A. Canera Information: APPLICANT: Gary L. Breton et al. TITLE OF INVENTION: NUCLEIC ACID AMINO ACID SEQUENCES RELATING TO ACINETOBACTER; TITLE OF INVENTION: BAUMANNII FOR DIAGNOSTICS AND THERAPEUTICS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
